

The hash function I made takes the original hash value, and takes it to the power of itself. Given the custom file's default number of partitions given by `n_partitions` (10 partitions) it takes .09 seconds, compared to the default file's default number of partitions (27 partitions), which takes .08 seconds. However, if you set the custom file's partitions to 27, the time it takes is the same .08 seconds. More partitions means less collisions, so it makes sense that the time decreased.
